Information for the role of Research Area VI – Biological Systems Early Career Representative

Research Area IV covers the broad areas of biological clocks, gene therapy, embryogenesis, organogenesis, innate immunity, immune responses, inflammation, disease processes, ageing, cancer, plants, molecular medicine, neurodegeneration, parasitology, plant pathology, nutrition, cell division differentiation and death, cardiovascular disease, developmental biology, diabetes, matrix structure and tissue engineering.

Members of this Research Area meet quarterly to put forward ideas for conferences, review events proposals from within their field of expertise, encourage nominations to the Society’s Awards programme and engage with the Society’s events strategy.

We are looking for an Early Career Representative, (defined as those less than ten years from their PhD or other most recent qualification), who is engaged in one or more of these areas of research to provide input into discussions and collaborate with fellow members to support such activities. Areas covered by current committee members can be viewed on member profiles available here.

You will have the opportunity to network with peers and colleagues, helping to shape the Society’s meetings programme and input into the delivery of the wider Society strategy for the benefit of the community.
